

# Package: fwatlasbc (via r-universe)

October 29, 2024

**Title** Freshwater Atlas British Columbia

**Version** 0.0.1.9018

**Description** What the package does (one paragraph).

**License** MIT + file LICENSE

**URL** <https://poissonconsulting.github.io/fwatlasbc/>

**Depends** R (>= 4.1)

**Imports** chk (>= 0.8.1.9001), digest, dplyr, fwapgr (>= 0.1.0.9013), glue, lifecycle, lwgeom, purrr, sf, stats, stringr, tibble, tidyplus, tidyselect

**Suggests** covr, googleway, hms, mapview, readr, rlang, testthat (>= 3.0.0)

**Remotes** poissonconsulting/chk, poissonconsulting/fwapgr

**Config/testthat/edition** 3

**Encoding** UTF-8

**Language** en-US

**LazyData** true

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Repository** <https://poissonconsulting.r-universe.dev>

**RemoteUrl** <https://github.com/poissonconsulting/fwatlasbc>

**RemoteRef** HEAD

**RemoteSha** 14beb33f839737efd00ee478c3a6d37ff147d7c4

---

fwa\_add\_blks\_to\_stream\_name

*Add Blue Line Key(s) to Stream Name*

---

### Description

Adds blue line keys (blk) to stream names. There may be more than one stream with the same name.

### Usage

fwa\_add\_blks\_to\_stream\_name(x, stream\_name = fwatlasbc::fwa\_stream\_name)

**Arguments**

x	A data frame with character column stream_name.
stream_name	A data frame with whole numeric column blk and character column stream_name.

**Value**

A tibble with the columns of x plus an integer column blk.

**Examples**

```
fwa_add_blks_to_stream_name(data.frame(stream_name = "Sangan River"))
```

---

```
fwa_add_blk_to_lon_lat
```

*Add Blue Line Key to Longitude and Latitude*

---

**Description**

Adds integer blue line key (blk) and numeric river meter (rm) column and sfc point (geometry) column of the closest point on the stream network (by default within 5 km) to the point specified by the lon and lat (WGS84).

**Usage**

```
fwa_add_blk_to_lon_lat(
  x,
  tolerance = 5000,
  limit = 1,
  epsg = getOption("fwa.epsg", 3005),
  nocache = getOption("fwa.nocache", FALSE)
)
```

**Arguments**

x	A data frame with numeric longitude (long) and latitude (lat) columns.
tolerance	A number of the tolerance in m.
limit	A positive whole number indicating the maximum number of features to return.
epsg	A positive whole number of the EPSG projection for the geometry.
nocache	A flag specifying whether or not to cache results.

**Details**

If a match isn't found the row is dropped.

**Value**

An sf tibble with the columns of x plus integer column blk, real columns rm and distance\_to\_lon\_lat and sfc point column geometry

**Examples**

```
## Not run:
fwa_add_blk_to_lon_lat(data.frame(lon = -132.26, lat = 53.36))

## End(Not run)
```

---

```
fwa_add_collection_to_polygon
      Add Collection to Polygon
```

---

**Description**

Adds collection to a polygon such as a watershed. If the active sfc polygon column is called geometry it is replaced by the geometry column of the collection. If the collection includes a blue\_line\_key column the values are copied to column blk replacing any existing values.

**Usage**

```
fwa_add_collection_to_polygon(
  x,
  collection = "stream_network",
  intersect = FALSE,
  filter = NULL,
  limit = 10000,
  offset = 0,
  properties = NULL,
  transform = NULL,
  epsg = getOption("fwa.epsg", 3005),
  nocache = getOption("fwa.nocache", FALSE)
)

fwa_add_collection_to_watershed(
  x,
  collection = "stream_network",
  intersect = FALSE,
  filter = NULL,
  limit = 10000,
  offset = 0,
  properties = NULL,
  transform = NULL,
  epsg = getOption("fwa.epsg", 3005),
  nocache = getOption("fwa.nocache", FALSE)
)
```

**Arguments**

x	A sf object with an active sfc polygon column.
collection	A character string of the collection.
intersect	A logical vector specifying whether to intersect the individual features with the polygon as opposed to just including the features that intersect it.
filter	A named vector or list of the filter(s) to apply, where the list names correspond to column names and the list values correspond to the desired value, e.g. <code>list(gnis_name = "Sangan River")</code> .
limit	A positive whole number indicating the maximum number of features to return.
offset	A positive whole number indicating the offset of start of returned results.
properties	A vector of strings of the column names to include. If NULL (default), all columns are retained.
transform	A character vector with the name of the <i>valid transform</i> function followed by the parameter values (e.g. <code>c("ST_Simplify", 100)</code> )
epsg	A positive whole number of the epsg to transform features to.
nocache	A flag specifying whether or not to cache results.

**Value**

An sf object

**Functions**

- `fwa_add_collection_to_watershed()`: **[Superseded]**  
Deprecated for `fwa_add_collection_to_polygon()`.

**See Also**

[fwapgr::fwa\\_collection\(\)](#).

**Examples**

```
## Not run:
watershed <- fwa_add_watershed_to_blk(data.frame(blk = 356308001))
fwa_add_collection_to_polygon(watershed)

## End(Not run)
```

---

fwa\_add\_cut\_to\_rms     *Add Cut to River Meter*

---

### Description

Adds value(s) in cut column in y to to column of same name in x based on blk and rm\_start and rm\_end in y.

### Usage

```
fwa_add_cut_to_rms(x, y, cut = "cut")
```

### Arguments

x	A data frame with integer columns blk and rm.
y	A data frame with integer columns blk, rm_start, rm_end and column specified in cut.
cut	A string of the name of the column in y with the values.

### Value

A tibble of x with cut column from y.

---

fwa\_add\_downstream\_split\_to\_rms  
*Add Split to River Meter*

---

### Description

Splits river meters with parent\_blk and parent\_rm columns into upstream (TRUE) versus not (FALSE).

### Usage

```
fwa_add_downstream_split_to_rms(x, y)
```

### Arguments

x	A data frame with integer columns blk, rm, parent_blk and parent_rm.
y	A data frame with integer columns blk and rm and character column name.

### Value

A tibble of x with a logical column for each name in name.

---

`fwa_add_gm_elevation_to_point`*Add Google Maps Elevation to Point*

---

**Description**

Add Google Maps Elevation to Point

**Usage**

```
fwa_add_gm_elevation_to_point(  
  x,  
  chunk_size = 300L,  
  digits = 7,  
  key = Sys.getenv("GOOGLE_MAPS_ELEVATION_API_KEY")  
)
```

**Arguments**

<code>x</code>	An sf object of spatial points.
<code>chunk_size</code>	The number of rows to include in each API query.
<code>digits</code>	The number of digits to round the latitude and longitude by before querying the elevation from the API
<code>key</code>	A string of the Google Maps Elevation API key.

**Value**

An updated version of `x` with numeric column elevation.

**See Also**

`googleway::google_elevation()`

**Examples**

```
## Not run:  
rm <- fwa_add_rms_to_blk(data.frame(blk = 356308001))  
fwa_add_gm_elevation_to_point(rm)  
  
## End(Not run)
```

---

fwa\_add\_intersection\_to\_geometry  
*Add Intersection to Geometry*

---

**Description**

Adds a logical column for each name in name in y indicating whether each element of x intersects with the element of y.

**Usage**

```
fwa_add_intersection_to_geometry(x, y)
```

**Arguments**

x	An sf data frame.
y	An sf data frame with character column name.

**Value**

A copy of x with a logical column for each name in name indicating whether each element of x intersects with the element of y.

---

fwa\_add\_new\_blk\_rm\_to\_blk\_rm  
*Add New Blue Line Key and River Meter to Blue Line Key and River Meter*

---

**Description**

Adds new blk and rm values to existing blk and rm values based on look up in second data frame.

**Usage**

```
fwa_add_new_blk_rm_to_blk_rm(
  x,
  y,
  blk = "blk",
  rm = "rm",
  blk2 = "blk",
  rm2 = "rm",
  new_blk = "new_blk",
  new_rm = "new_rm",
  new_blk_to = new_blk,
  new_rm_to = new_rm
)
```

**Arguments**

x	A tibble (or sf object) with blk and rm columns.
y	A tibble (or sf object) with unique blk and rm columns and new blk (optional) and rm columns.
blk	A string of the name of the blk column in x.
rm	A string of the name of the rm column in x.
blk2	A string of the name of the blk column in y.
rm2	A string of the name of the rm column in y.
new_blk	An optional string of the name of the new blk column in y. If NULL it is not used in the join.
new_rm	A string of the name of the new rm column in y.
new_blk_to	A string specifying the name to rename the new blk column with.
new_rm_to	A string specifying the name to rename the new blk column with.

**Value**

An updated version of x with additional columns for the new blk and rm columns.

**See Also**

[fwa\_add\_new\_rm\_to\_blk\_rm()]

---

fwa\_add\_rms\_to\_blk      *Add River Meters to Blue Line Key*

---

**Description**

Adds distances (rm) and spatial coordinates (geometry) of regularly spaced points along blue line key (blk). All distances which are in meters are from the river mouth.

**Usage**

```
fwa_add_rms_to_blk(
  x,
  interval = 1000,
  start = 0,
  end = Inf,
  epsg = getOption("fwa.epsg", 3005),
  nocache = getOption("fwa.nocache", FALSE)
)
```

**Arguments**

x	A data frame with integer column blk.
interval	A whole numeric of the distance between points.
start	A whole numeric of the start distance.
end	An integer of the end distance.
epsg	A positive whole number of EPSG projection for the coordinates.
nocache	A flag specifying whether or not to cache results.

**Value**

An sf tibble with the columns of x plus integer column rm and sf column geometry.

**Examples**

```
## Not run:
fwa_add_rms_to_blk(data.frame(blk = 356308001))

## End(Not run)
```

---

fwa\_add\_section\_to\_rms

*Add Section to River Meter*

---

**Description**

Adds section column in y to x based on blk and end rm in y. All rms in x up to and including the end rm but before the previous end rm are assigned the section column value (which can be missing).

**Usage**

```
fwa_add_section_to_rms(x, y, section = "section")
```

**Arguments**

x	A data frame with integer columns blk and rm.
y	A data frame with integer columns blk and rm and column specified in section.
section	A string of the name of the column in y (can include missing values).

**Value**

A tibble of x with section column from y.

---

fwa\_add\_stream\_names\_to\_blk  
*Add Blue Line Key(s) to Stream Name*

---

**Description**

Adds blue line keys (blk) to stream names. There may be more than one stream with the same name.

**Usage**

```
fwa_add_stream_names_to_blk(x, stream_name = fwatlasbc::fwa_stream_name)
```

**Arguments**

x                    A data frame with whole numeric column blk.  
stream\_name        A data frame with whole numeric column blk and character column stream\_name.

**Value**

A tibble with the columns of x plus an integer column blk.

**Examples**

```
fwa_add_stream_names_to_blk(data.frame(blk = 360886335L))
```

---

fwa\_add\_upstream\_split\_to\_rms  
*Add Split to River Meter*

---

**Description**

Splits river meters with parent\_blk and parent\_rm columns into upstream (TRUE) versus not (FALSE).

**Usage**

```
fwa_add_upstream_split_to_rms(x, y)
```

```
fwa_add_split_to_rms(x, y)
```

**Arguments**

x                    A data frame with integer columns blk, rm, parent\_blk and parent\_rm.  
y                    A data frame with integer columns blk and rm and character column name.

**Value**

A tibble of x with a logical column for each name in name.

**Functions**

- `fwa_add_split_to_rms()`: Soft-deprecated [**Deprecated**]

---

fwa\_add\_watershed\_to\_blk

*Add Watershed to Blue Line Key*

---

**Description**

Adds polygon (geometry) of aggregated fundamental watersheds to blue line key (blk). The rm distances which is in meters is from the river mouth.

**Usage**

```
fwa_add_watershed_to_blk(
  x,
  exclude = FALSE,
  epsg = getOption("fwa.epsg", 3005),
  nocache = getOption("fwa.nocache", FALSE)
)
```

**Arguments**

x	An sf object with a polygon sfc column specifying watersheds and an optional rm column specifying the river meter. The rm is set to be 0 if missing.
exclude	A logical vector specifying whether to exclude the fundamental watershed in which the start falls.
epsg	A positive whole number of the epsg to transform features to.
nocache	A flag specifying whether or not to cache results.

**Value**

An sf tibble with the columns of x plus sf column geometry.

A sf object

**See Also**

[fwapgr::fwa\\_watershed\\_at\\_measure\(\)](#).

**Examples**

```
## Not run:  
fwa_add_watershed_to_blk(data.frame(blk = 356308001))  
  
## End(Not run)
```

---

fwa_collection_name	<i>Collection Name</i>
---------------------	------------------------

---

**Description**

A tibble of collection names.

**Usage**

```
fwa_collection_name
```

**Format**

An object of class `spec_tbl_df` (inherits from `tbl_df`, `tbl`, `data.frame`) with 12 rows and 2 columns.

**Examples**

```
fwa_collection_name
```

---

fwa_convert_rms_to_streams	<i>Convert River Metres to Streams</i>
----------------------------	--

---

**Description**

Casts river metre points to linestrings by blk.

**Usage**

```
fwa_convert_rms_to_streams(x)
```

**Arguments**

x                    An point sf object with whole numeric columns blk and rm.

**Value**

A linestring sf object with whole numeric columns blk and rm.

---

`fwa_convert_streams_to_rms`*Convert Streams to River Meters*

---

## Description

Converts a tibble of streams to river meters. Unlike `fwa_convert_stream_network_to_rms()` it only requires the linestrings and the unique integer identifier for each stream.

## Usage

```
fwa_convert_streams_to_rms(  
  x,  
  interval = 5,  
  gap = 1,  
  end = NULL,  
  elevation = FALSE,  
  reverse = integer()  
)
```

## Arguments

<code>x</code>	An sf tibble with a column <code>blk</code> and linestrings of streams.
<code>interval</code>	A positive whole number of the distance (m) between points.
<code>gap</code>	A positive real number specifying the maximum gap (m) between the mouth of stream and its parent stream to be considered connected.
<code>end</code>	A positive whole number indicating how far (m) the end of the stream linestring has to be from the last interval to be included. To default <code>end = NULL</code> (equivalent to <code>end = interval + 1</code> ) excludes ends.
<code>elevation</code>	A flag specifying whether to use the elevation from Google Maps to determine stream direction (or use the direction of the provided linestrings)
<code>reverse</code>	A whole numeric vector of streams to reverse direction ignoring elevation.

## Value

An sf tibble with the columns `blk`, integer column `rm` and sf column point geometry.

## See Also

[fwa\\_convert\\_stream\\_network\\_to\\_rms\(\)](#)

**Examples**

```
## Not run:
watershed <- fwa_add_watershed_to_blk(data.frame(blk = 356308001, rm = 1000))
network <- fwa_add_collection_to_polygon(watershed)
network <- select(network, blk = blue_line_key)
fwa_convert_streams_to_rms(network, interval = 100)

## End(Not run)
```

---

```
fwa_convert_stream_names_to_blks
```

*Converts Stream Names to Blue Line Keys*

---

**Description**

Each stream name is converted to a blue line key by calculating it's integer hash.

**Usage**

```
fwa_convert_stream_names_to_blks(names)
```

**Arguments**

names            A character vector of stream names.

**Details**

This function is only expected to be used when a blue line key does not already exist.

**Value**

An positive integer vector of blue line keys.

**Examples**

```
fwa_convert_stream_names_to_blks(c("a stream name", "a stream name2"))
```

---

`fwa_convert_stream_network_to_rms`*Convert Stream Network to River Meters*

---

**Description**

Converts a tibble of a BC stream network to river meters.

**Usage**

```
fwa_convert_stream_network_to_rms(x, interval = 5, tolerance = 0.1)
```

**Arguments**

<code>x</code>	An sf tibble of a stream network.
<code>interval</code>	A whole number of the distance between points.
<code>tolerance</code>	A number of the acceptable discrepancy in meters in the network lengths.

**Value**

An sf tibble with the columns of `x` plus integer column `rm` and sf column geometry.

**See Also**

[fwa\\_convert\\_streams\\_to\\_rms\(\)](#)

**Examples**

```
## Not run:
watershed <- fwa_add_watershed_to_blk(data.frame(blk = 356308001, rm = 1000))
network <- fwa_add_collection_to_polygon(watershed)
fwa_convert_stream_network_to_rms(network, interval = 100)

## End(Not run)
```

---

`fwa_find_stream_names` *Find Stream Names*

---

**Description**

Finds gnis stream names that match regular expression.

**Usage**

```
fwa_find_stream_names(pattern = ".*", ignore_case = TRUE)
```

**Arguments**

pattern	A string of a regular expression.
ignore_case	A flag specifying whether to ignore case when matching the regular expression to gnis stream names.

**Value**

A tibble with character column stream\_name of the names of all the streams that match the regular expression.

**Examples**

```
fwa_find_stream_names("sangan")
```

---

```
fwa_get_section_from_rms
```

*Get Section from River Meter*

---

**Description**

Gets sf tibble of section blk, rm, length and geometry where sections are defined by the their most upstream point.

**Usage**

```
fwa_get_section_from_rms(x, section = "section")
```

**Arguments**

x	A data frame with integer columns blk and rm.
section	A string of the name of the column in x that specifies the sections.

**Value**

A sf tibble with integer columns blk, rm, length and a geometry where rm and geometry are the upstream end of the section.

---

 fwa\_get\_segment\_from\_rms

*Get Segment from River Meter*

---

### Description

Gets sf tibble of section blk, rm\_start, rm\_end, segment and line geometry.

### Usage

```
fwa_get_segment_from_rms(x, segment = "segment")
```

### Arguments

x	A data frame with integer columns blk and rm.
segment	A string of the name of the column in x, which must be a character or factor vector, that specifies which segment each rms belongs to.

### Value

A sf tibble with integer columns blk, rm\_start, rm\_end, character/factor segment and a line geometry.

---

fwa\_join\_stream\_segments

*Join Stream Segments*

---

### Description

Converts a tibble of stream segment linestrings to stream linestrings.

### Usage

```
fwa_join_stream_segments(x, elevation = FALSE, reverse = integer())
```

### Arguments

x	An sf tibble with a column blk and linestrings of stream segments.
elevation	A flag specifying whether to use the elevation from Google Maps to determine stream direction (or use the direction of the provided linestrings)
reverse	A whole numeric vector of streams to reverse direction ignoring elevation.

### Value

An sf tibble with the columns blk and sfc column point geometry.

**See Also**

[fwa\\_convert\\_streams\\_to\\_rms\(\)](#)

**Examples**

```
## Not run:
watershed <- fwa_add_watershed_to_blk(data.frame(blk = 356308001, rm = 1000))
network <- fwa_add_collection_to_polygon(watershed)
network <- select(network, blk = blue_line_key)
fwa_join_stream_segments(network)

## End(Not run)
```

---

fwa\_mapview

*Map View*

---

**Description**

A wrapper on `mapview::mapview.sf()` that allows the user to layer by a column and coerces hms columns to character (to avoid being dropped).

**Usage**

```
fwa_mapview(x, layer = NULL, zcol = NULL, legend = FALSE, ...)
```

**Arguments**

`x` An sf data frame.

`layer` A string of the column to layer the points by.

`zcol` A string of the column to color points by.

`legend` A flag specifying whether to plot a legend.

`...` Additional arguments passed to `mapview::mapview()`.

---

fwa\_mapview\_rms

*Map View River Meters*

---

**Description**

Map View River Meters

**Usage**

```
fwa_mapview_rms(
  x,
  layer = NULL,
  zcol = "rm",
  legend = FALSE,
  npoint = 250,
  ...
)
```

**Arguments**

x	An sf data frame with unique integer columns blk and rm.
layer	A string of the column to layer the points by.
zcol	A string of the column to color points by.
legend	A flag specifying whether to plot a legend.
npoint	An indication of the total number of points to plot.
...	Additional arguments passed to mapview::mapview().

---

fwa\_mapview\_rms\_to\_rms

*Map View River Meters*

---

**Description**

Maps two alternative stream networks by adding links from each point in x to matching point in y.

**Usage**

```
fwa_mapview_rms_to_rms(x, y, zcol = "rm", npoint = 250)
```

**Arguments**

x	An sf data frame with unique integer columns blk and rm and integer column new_rm.
y	An sf data frame with unique integer columns blk and rm.
zcol	A string of the column to color points by.
npoint	An indication of the total number of points to plot.

---

fwa\_parent\_blk\_rms      *Parent Blue Line Key*

---

**Description**

Gets parent blue line key.

**Usage**

```
fwa_parent_blk_rms(x, rms)
```

**Arguments**

x	A whole numeric vector of one or more blue line keys.
rms	A data frame with integer columns blk and parent_blk. There must be only one parent_blk for each blk.

**Value**

A whole numeric vector of the parent blue line keys.

---

fwa\_parent\_stream\_name\_rms  
*Parent Stream Name*

---

**Description**

Gets parent stream name.

**Usage**

```
fwa_parent_stream_name_rms(x, rms, stream_name = fwatlasbc::fwa_stream_name)
```

**Arguments**

x	A character vector of one or more stream names.
rms	A data frame with integer columns blk and parent_blk. There must be only one parent_blk for each blk.
stream_name	A data frame with character column stream_name and integer column blk. There must be no more than one blk for the stream names specified.

**Value**

A character vector of the parent blue line keys.

---

fwa_prune_rms	<i>Prune River Meter</i>
---------------	--------------------------

---

**Description**

Removes river meters above rm values in y.

**Usage**

```
fwa_prune_rms(x, y)
```

**Arguments**

x	A data frame with integer columns blk, rm, parent_blk and parent_rm.
y	A data frame with integer columns blk and rm.

**Value**

A tibble of x with rows above the rms in y removed.

---

fwa_snap_rms_to_rms	<i>Snap River Meters to River Meters</i>
---------------------	--

---

**Description**

Assigns closest river meters to river meters by blue line keys using fwa\_snap\_rm\_to\_rms() rm must not have an existing new\_rm column.

**Usage**

```
fwa_snap_rms_to_rms(x, rm, snap_mouths = FALSE)
```

**Arguments**

x	An sf object of spatial points with blk and rm columns and optional new_blk and new_rm integer column.
rm	An sf object of spatial point with blk and rm columns.
snap_mouths	A flag specifying whether to snap pairs of streams at their mouths (rm = 0) where new_rm is not already set.

**Details**

x is first snapped to rm then rm is snapped to x while ensuring that the links between x and rm are bidirectional as much as possible.

**Value**

A named list with an updated versions of `x` and `rm` with integer columns `blk`, `new_blk`, `rm` and `new_rm` and numeric column `distance_to_new_rm`.

**See Also**

[fwa\\_snap\\_rm\\_to\\_rms\(\)](#)

**Examples**

```
rm <- fwa_add_rms_to_blk(data.frame(blk = 356308001))
x <- rm[rm$rm %in% c(0, 2000, 5000, 6000, 7000), ]
rm <- rm[rm$rm %in% c(1000, 3000, 4000, 8000, 9000, 10000), ]
fwa_snap_rms_to_rms(x, rm)
```

---

fwa\_snap\_rm\_to\_point    *Snap River Meter to Point*

---

**Description**

Assigns closest river meter to each spatial point. If the blue line key (`blk`) is missing then it is also assigned together with the distance to the river meter (`distance_to_rm`) in m.

**Usage**

```
fwa_snap_rm_to_point(x, rm, ...)
```

**Arguments**

<code>x</code>	An sf object of spatial points with optional integer column <code>blk</code> .
<code>rm</code>	An sf object of spatial point with <code>blk</code> and <code>rm</code> columns.
<code>...</code>	Additional columns to group by when assigning. Elements with missing values in <code>rm</code> are assigned to any value in <code>x</code> .

**Value**

An updated version of `x` with integer columns `blk` and `rm` and numeric column `distance_to_rm`.

**Examples**

```
rm <- fwa_add_rms_to_blk(data.frame(blk = 356308001))
x <- rm[rm$rm %in% c(0, 2000, 5000, 6000, 7000), ]
rm <- rm[rm$rm %in% c(1000, 3000, 4000, 8000, 9000, 10000), ]
fwa_snap_rm_to_point(x, rm)
```

---

fwa\_snap\_rm\_to\_rms      *Snap River Meter to River Meters*

---

### Description

Assigns closest river meter to river meters based on blue line keys. If `x` already includes `new_rm` column then non-missing values are preserved. The non-missing `new_rm` values must be ordered (with respect to `x$rm`) and must be present in `rm$rm`. If `x` already includes `new_blk` then river meters can be assigned to a creek with a different blue line key and/or river meters from multiple creeks can be assigned to the same creek (for example in the case of a previously unmapped side channel and the mainstem).

### Usage

```
fwa_snap_rm_to_rms(x, rm, snap_mouths = FALSE)
```

### Arguments

<code>x</code>	An sf object of spatial points with <code>blk</code> and <code>rm</code> columns and optional <code>new_rm</code> integer and <code>new_blk</code> columns.
<code>rm</code>	An sf object of spatial point with <code>blk</code> and <code>rm</code> columns.
<code>snap_mouths</code>	A flag specifying whether to snap pairs of streams at their mouths ( <code>rm = 0</code> ) where <code>new_rm</code> is not already set.

### Details

The closest river meter is snapped to each `rm` (by `blk = new_blk`) and missing `new_rm` values are replaced with the corresponding `rm` value. The `new_rm` values are then ordered by adjusting the values so that firstly all previous values are not greater than each provided `new_rm` value and then all subsequent values are not less than the maximum previous value. Next all runs of two or more identical `new_rm` values that do not include a provided `new_rm` are interpolated between the previous and subsequent `new_rm` values based on the original `rm` spacing and then snapped to the closest `rm` value in `rm`.

To ensure that pairs of streams snap at their mouths set the `new_rm` to be 0 where the `rm` is 0 or set `snap_mouths = TRUE`

### Value

An updated version of `x` with integer columns `blk`, `rm`, `new_blk`, `new_rm` and numeric column `distance_to_new_rm`.

### Examples

```
rm <- fwa_add_rms_to_blk(data.frame(blk = 356308001))
x <- rm[rm$rm %in% c(0, 2000, 5000, 6000, 7000), ]
rm <- rm[rm$rm %in% c(1000, 3000, 4000, 8000, 9000, 10000), ]
fwa_snap_rm_to_rms(x, rm)
```

---

fwa\_snap\_stream\_measure\_to\_point  
*Snap Stream Measure to Point*

---

## Description

Assigns closest stream measure in m to each spatial point. If the blue line key (blk) is missing then it is also assigned together with the distance to the stream (distance\_to\_stream) in m.

## Usage

```
fwa_snap_stream_measure_to_point(x, streams, ...)
```

## Arguments

x	An sf object of spatial points with optional integer column blk.
streams	An sf object of spatial linestrings with blk column.
...	Additional columns to group by when assigning.

## Value

An updated version of x with integer columns blk and stream\_measure and numeric column distance\_to\_stream.

## See Also

[fwa\\_snap\\_rm\\_to\\_point\(\)](#)

## Examples

```
## Not run:
watershed <- fwa_add_watershed_to_blk(data.frame(blk = 356308001, rm = 1000))
network <- fwa_add_collection_to_polygon(watershed)
network$blk <- network$blue_line_key
streams <- fwa_join_stream_segments(network)
points <- fwa_add_rms_to_blk(data.frame(blk = 356308001))
fwa_snap_stream_measure_to_point(points, streams)

## End(Not run)
```

---

fwa_stream_name	<i>Stream Name</i>
-----------------	--------------------

---

**Description**

A tibble of stream names with blue line keys.

**Usage**

```
fwa_stream_name
```

**Format**

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 11606 rows and 2 columns.

**Examples**

```
fwa_stream_name
```

---

fwa_swap_branches_rms	<i>Swap Branches of River Meters</i>
-----------------------	--------------------------------------

---

**Description**

Swaps two branches of river meters.

**Usage**

```
fwa_swap_branches_rms(x, y, adjust_points = TRUE)
```

**Arguments**

`x` A data frame with integer columns `blk`, `rm`, `parent_blk` and `parent_rm`.

`y` A data frame with integer column `blk` specifying the blue line key that currently begins at the confluence of the two branches.

`adjust_points` A flag specifying whether to adjust the coordinates of points which move.

**Value**

A copy of `x` with the branches swapped.
